

SAP® Integration

ImageSite integrates with SAP by providing easy access for viewing and printing of documents.. ImageSite works in tandem with SAP to provide secure, on-demand viewing and batch printing of documents for non-designers and purchasing users. Using their SAP interface, users can search for specific documents and drawings and launch their web browser to view images or send documents for printing worldwide. Documents can be published to any ImageSite extranet server making them available to vendors or contractors needing access outside the company network.

ImageSite can be configured for multiple channels with SAP and KPro (SAP's document repository) ensuring adequate throughput is achieved. ImageSite provides access control and authentication to ensure users have the appropriate level of access (including viewing and printing) to sensitive documents. Because ImageSite streams images as a web server, viewer files are never downloaded to a user machine or stored on local disk. This highly secure control safeguards information from being directly accessed, ensuring security of confidential and export-controlled documents.

Benefits

- Searching is simple and intuitive, allowing casual users easy access to needed documents from their familiar SAP interface.
- Publishing to an "extranet," ImageSite facilitates tight control over vendor access, with documents expiring after given periods.
- Deployment and expansion are simple as no client software is needed and single sign-on with SAP makes it seamless to the user.
- Provides server-based printing and plotting, including set processing, plot labels, watermarks, and publishing to PDF.
- Easily to view and manage a large quantity of print requests simultaneously.
- A single viewer for display and printing of all file types.
- Streaming raw information from the ImageSite web server makes data highly secure and avoids a security vulnerability.

Solution

Users are able to quickly view or print multiple documents and images, using their web browser, without the need to download them.

ImageSite stores all accessed documents in a local cache for enhanced view and print performance while ensuring the most recent version is displayed or printed.

ImageSite's extranet servers provide tight control over documents for external vendors and automatically removes files after the configurable period.

In addition, multiple channels are established between SAP and ImageSite allowing throughput levels to be configured.

ImageSite can also be configured to link between multiple environments (e.g., production and development) allowing for easy testing or upgrade before committing to production.
